The Impact of Consumer Decision Making Process towards Apparel Buying in the U.K

Abstract:

The objective of the study was to examine the effect of visual merchandising on customers' purchase decisions in the apparel sector in the UK. A questionnaire was applied to collect quantitative data on the influence of the window display and the store design, layout, atmosphere, and loyalty on purchase-related decision making. The sample size of the study was 150 participants. The R and SPSS 25 statistical programmes were used for the analysis of the collected data and data visualisation. The linear regression analysis was applied. The results suggest that the window display and the store design, layout, atmosphere, and loyalty affect the customer's decision-making process. These results present implications for managers in considering visual merchandising to increase in-store traffic and sales. Future studies should consider visual merchandising factors in the online environment.

Keywords-Quantitative, Linear Regression, Visual, Consumer Behaviour, Merchandising, Apparel, Data Visualisation, SPSS, R

1. INTRODUCTION

Visual merchandising is an effective means for stores or companies to communicate their fashion values and quality image to their consumers (Jain et al., 2012). Visual merchandising's principal objective is to inform the customers on the current collections as well products, improve the store's image and encourage increased sales through the presentation of apparel and accessories (Nueno, J.L. and Quelch, J.A., 1998). It promotes purchases by appealingly demonstrating products and services at an important phase in the purchasing process (Jain et al., 2012). Saricam et al. (2018) confirmed Moayery and Vazifehdoost's(2014) study concerning visual merchandising's potential of creating an eye-catching and appealing effect by altering the perceived image in customers' minds. The ability of the store layout and atmosphere to guide consumers towards buying goods in retail stores means that visual merchandising impacts consumer behaviour and encourages brand loyalty, leading to the company's competitive advantage against its competitors (Ahmad, A., 2021).

This research aimed to identify different visual merchandising elements that affect customers' decision-making during shopping in retail apparel stores in the UK. The research contains information and facts on the process of decision-making that influence customers' purchase decisions, highlighting several factors such as the window display and the store design, layout, atmosphere, and loyalty. Visual merchandising was also considered in this research, highlighting some of its major advantages in increase the customer and sales.

2. Methods:

2.1. The methodology section aims at identifying the research philosophy, research approach, and research design in the study. This section also outlines data collection approaches and instruments, as well as data analysis software.

2.2. Research Philosophy

The research philosophy goes into the setting of the consumer conduct dynamic interaction at decision-making process. In this way, the cognitive processes associated with purchaser buying choices and how purchasing choices are made.

In this research, positivism research reasoning is utilised. Positivist scientists believe that society shapes individuals and uses quantitative exploration strategies. Positivists accept that the activities of individuals can by and large be made sense of by normal practices they have been presented to through socialisation. The general focal point of research is on revealing the regulations which govern human way of behaving. Consequently, in this review, the specialist uncovers the elements which influence the buy decision-making of clients in the clothing sector. Positivist researcher centre around doing enormous scope reviews for getting an outline of society all in all and uncovering social patterns, for example, connections between visual merchandising and consumer decision making.

2.3. This study employed quantitative research approaches on the principles of positivists, which perceive societal norms as the driver of people's lives. The general focus on research is on uncovering the laws which govern human behaviour (Saunders et al. 2009). Thus, in this study, the researcher uncovered the factors which affect the purchase decision making of customers in the apparel sector (Saunders et al. 2009). Positivists focus on doing large-scale surveys for getting an overview of the society as a whole and uncovering social tends such as relationships among visual merchandising and customer decision making.

2.4. Research Approach

The approach that shapes this study prevails as deduction reasoning, which often draws specific conclusions from general principles. It moves from generalisation towards a specific conclusion. A deductive research approach which starts with a theory, hypothesis development from the theory, and collecting and analysing data to test the hypothesis (Curwin et al. 2013). Thus, a deductive approach is the one that could originate from propositions of the theory. There are some benefits of using deductive reasoning, which include the likelihood of explaining causal relationships among variables, the possibility for measuring different concepts quantitatively, and generalising the research findings.

3. Research Design

This study applies a quantitative research design that emerges as an investigative strategy or structure which aims at obtaining answers to the research problem. This design demonstrates the procedures and guidelines of this study from Alfa to Omega (Saunders et al., 2009). The application of quantitative research helped to focus on statistical and mathematical analysis of data gathered using polls, surveys, or questionnaires (Saunders et al. 2009). This kind of research focused on collecting numerical data and generalise the findings of a group of people for explaining a particular phenomenon. The objective of conducting quantitative research is finding the relationship of visual merchandising (store design and layout, window display, store atmosphere, and store loyalty) on the purchasing behaviour of customers in the apparel sector.

4. Data Collection

Generally, data collection happens through two methods: primary and secondary. Primary data is the one which the researcher collects himself, whereas secondary data comes from the previous journal articles, books, and websites (David & Sutton, 2010). The researcher in this study collects primary data through survey questionnaires, whereas all the secondary data originates from previous journal articles, websites (www.data.gov), reports, and

books. Data has been collected from different sources including some expanding resources for gathering the customer's decision making on the purchase of apparel. Several interviews have been conducted by targeting different customers from different regions and these interviews helped in identification of the issues. Along with the interviews, there are distinct questionnaires prepared for obtaining the responses from multiple customers regarding the decision-making process and reacting based on different components. These factors vary according to the decisional approaches made and the survey that included the questionnaire contained multiple questions focusing on the behaviour of the apparel purchase (Binninger, 2008).

5. Research Instrument

The prevailing research embraced a questionnaire as its research instrument. A questionnaire is a list of questions to which respondents answer. For the questionnaire, it is important that all questions are easily read to the sequence of questions must be easy to follow. The formulation of a questionnaire must base on an interactive style (David & Sutton, 2010). There are some benefits for using questionnaire as research instruments such as it is less expensive and do not require to interview respondents. Moreover, the use of the questionnaire is also convenient, and it is one of the most inexpensive methods to collect data. The questionnaire also helps maintain the anonymity of the respondents (Kumar 2019, p. 148). A close-ended questionnaire helped to measure the response of participants by allowing respondents to choose the option which best defines their behaviour or attitude. For designing the questionnaire, the author used a 5-point Likert scale to measure the response of people. This type of questionnaire posed two limitations, namely lack of variety and depth in the responses and likely biases as researcher might list unpopular options. Moreover, respondents could choose the answer without thinking about the issue (Kumar 2019, p. 154). Thus, in this research, a questionnaire aims at analysing whether different visual merchandising factors could affect consumers' purchase decision while visiting apparel stores.

6. Sample

Sample size refers to the number of students, families of friends from who the data comes from, and exist as 'n.' The selection of the sample size would base on the fact that it is often challenging to add everyone in this research. This study's sample size is 150 participants comprising of young customers, male and female, aged 18-45 years old (Saunders et al. 2009). The study utilised a suitable method to select this sample size based on participants' availability and readiness. The population chosen for this research sample included several factors such as number of people to be included in the questionnaire itself along with pol subject and panel data that must be referred within it. The survey has been conducted through an online form that has been circulated to the people included in the survey (Chang, et al., 2011). Thus, in this research, the selection of the sample size occurred on the close proximity of respondents. Although this method offers easy and cheap access to participants, it could give inferior and biased outcomes, not applicable to the actual scenario.

7.Ethics

The involvement of human participants required this study to embrace ethical requirements that affirm their humanity. In concurrence with (Saunders et al. 2009), this research obtained informed consent from participants to verify that they voluntarily participated in the research. The study-maintained participants' confidentiality by keeping their information anonymous throughout the research (Oliver 2010). The study allowed participant withdrawal without conditions. Researchers kept the respondents' data in password-protected folders with specific study members accessing such critical data. This study wanted to store the data for approximately six months before its expiry.

8. Data Analysis

This research used SPSS 20, which is statistical software, to analyse the available data. The analysation of demographic data of the respondents happened courtesy of descriptive analysis and frequencies. Moreover, the testing of the hypothesis happened using regression analysis (Binninger, 2008). Bivariate correlation analysis helped to identify the relationships among different variables. Researchers presented the available data in the form of tables and graphs.

9. Validity and Reliability

It is important for the research to establish the quality of results. It is also essential to find the quality and appropriateness of the research; thus, the need to finding answers, and this process is known as validity. The term validity refers to the ability of an instrument to measure the appropriate feature, such as a questionnaire measuring the decision-making process (Chen & Yao, 2018). This word also means the extent to which the researcher could measure the items present in the questionnaire. Thus, reliability and validity associate with the internal consistency approach, which ensures that items in the questionnaire measure a similar underlying phenomenon. In this research, the evaluation of reliability and validity happened through Cronbach's Alpha. 10. **Results:**

From the chart presented above shows the distribution of the textile, clothing and foot ware stores data. The chartpresented, depicted a right-skewed distribution with many data values being on the left side, indicating that the data does not follow a normal distribution.

The chart presented above shows the distribution of the household goods stores data. The chart depicts a rightskewed distribution with many data values being on the left side, indicating that the data does not follow a normal distribution.

Available at <u>www.ijsred.com</u>

The line chart above shows the trend in the textile, clothing and footwear in the online apparel buying in the U.K. The chart depicts that there was an increasing trend in the textile, clothing and footwear in the online apparel buying from Jan 2008 to July 2020, which later started decreasing in December 2020. Thus, the textile, clothing and footwear in the online apparel buying data depicted an increasing and decreasing trends in the purchase of online apparels in the U.K.

The variable food indicates preferences and choices made by UK individuals. Individuals who does not have adequate capital prefer buying food to cloth. The line chart above shows the trend in the household good stores in the online apparel buying in the U.K. The chart depicts that there was an increasing trend in the household goods stores in the online apparel buying from Jan 2008 to July 2020, which later started decreasing in December 2020. Thus, household goods stores in the online apparel buying the U.K.

11. Discussion:

The regression analysis showedthat the window display affects customers'decision-making process (β =0.98). The store window is considered an iconic symbol of contemporary spectatorship and serves as a billboard for urban consumers and a frame to capture the mobilised spectators (Iarocci, 2013). Window displays visually communicate the company's value proposition and encourage buying behaviours (Chang et al., 2011). A positive relationship between customers' purchase decisions and window display has been previously documented (Merugu, 2017). The present results confirm previous literature demonstrating that creative and innovative window displays have a positive impact on customers by capturing their attention and influencing their opinion about the images of the store, positively affecting the experience of customers during shopping (Lange et al., 2016). Moreover, the window has been documented as a variable that affects the interaction reactions, between behavioural responses and shopping experience of customers, (Lucia-Palacios, Y. 2016), shaping their purchase intentions and behaviours (Hoyer, W.D., MacInnis, D.J. and Pieters, R., 2012) Customers use window displays to identify the products offered by the store and decide whether to enter or not the store, as shown in the present study that confirms the results by Lange et al. (2016). Lang et al. (2016) carried out a field experiment revealing that creative store window displays help capture the attention of consumers and positively affect their intentions to enter the store.

16. Analysis/Result Interpretation:

To evaluate the data of the online sales index, which illustrates the value of the company after adjustment for the depicted seasons mean charismas per date, and the percentage of online retailing sales, a multiple regression analysis was performed. The regression model evaluated the effectiveness of seven control variables derived from various sources of sales data as intercepts (all retailing excluding automotive fuel; food stores; non-food stores; non-specialised stores; household goods stores; other stores; and non-store retailing). The presumptions of normality, linearity, multicollinearity, and homoscedasticity were tested in advance.

The boxplots demonstrated that all the variables in the regression analysis were normally distributed, even though they included some univariate outliers that were deemed negligible. Then, the scatterplot of the standardised residuals against the standardised predicted values and the homogeneity of variance of the standardised residuals showed that the suppositions of homoscedasticity, normality and linearity were satisfied. Next, the Mahala Nobis distance in the dataset did not exceed the crucial value of 2 for df=7 (p=0.001), indicating the lack of multivariate outliers. The relatively high limits for all the predictors of the regression model showed that multicollinearity does not conflict with the interpretation the regression model thanks to its relatively high tolerance.

17. Conclusion

This quantitative research was conducted to demonstrate the influence of visual merchandising on decisionmaking in purchasing apparel. A positivist research philosophy and a deductive reasoning approach were applied to demonstrate the impact by using data collected from primary (questionnaire) and secondary (books, journal articles, websites, reports, etc.) sources. In the statistical analysis thesample size of the study was 150 participants who took part in online, and demographic based like age, gender, education level, income etc. The independent variables were the window display and the store layout, design, atmosphere, and loyalty, while the dependent variable was the purchase product in decision making process. All hypotheses developed in the research were accepted with store window (β =0.98, p= 0.000>=0.05), store layout and design (β =0.98, p= 0.000>= 0.05), store atmosphere (β =0.99, p= 0.000 >=0.05) and store loyalty (β =0.99, p= 0.000>= 0.05) presenting statistically significant results. The outcomes of this study demonstrated a significant relationship between the store window display, store layout, design, atmosphere and loyalty and the customers'decision-making process, highlighting these factors' effect on the decision of entering a store or purchasing goods.
